INCREASE THE USAGE OF VOICE INPUT ON THE CHATGPT MOBILE APP

Bhautik Patel
LinkedIn: linkedin.com/in/bhautikpatel0015/
Portfolio: nextleap.app/portfolio/bhautik-patel

Problem Statement: While voice input is available on the chatgpt app, very few users in India seem to be using it. Voice input could be a powerful tool, especially in a mobile-first country like India, but adoption has remained low. The task is to **increase the usage of voice input on the ChatGPT mobile app**

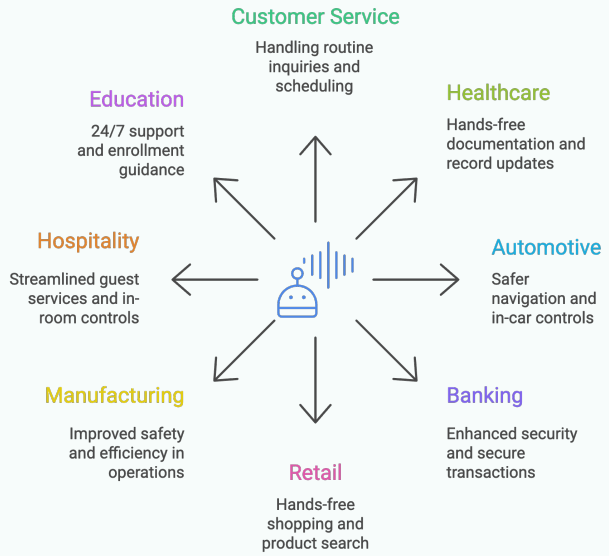
Slide 1: Understanding of the Indian voice-tech and mobile usage landscape

Voice Technology Segment

Voice Tech market is projected to expand at a 35.7% CAGR through 2030, reaching nearly USD 1 Billion revenue by 2030.

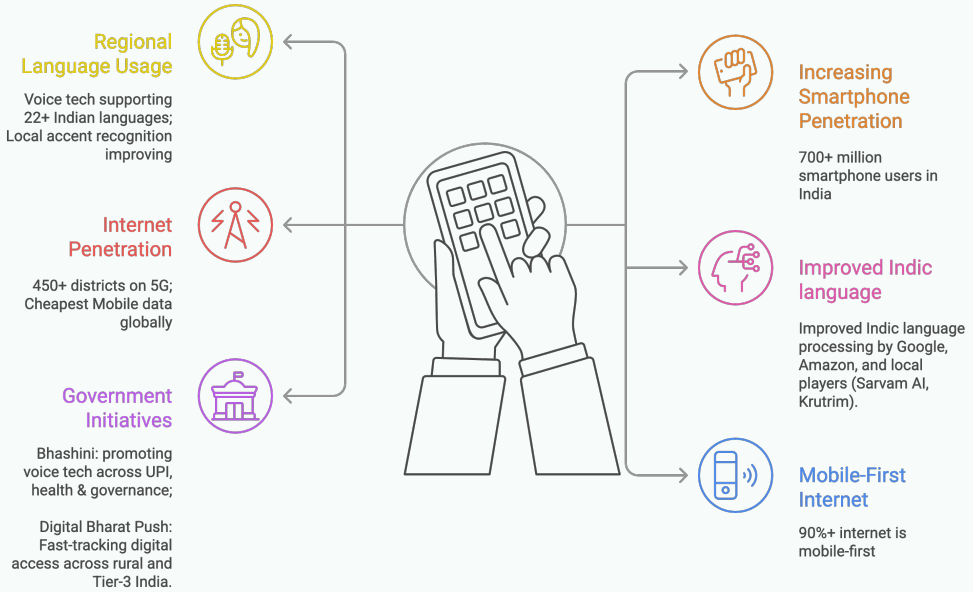
	Voice Recognition	Voice Assistant	Voice Commerce
Technology	Converts speech to text	AI with voice recognition and NLP	Voice assistants for buying/selling
Function	Identifies sounds and maps to words	Understands intent, manages tasks, responds	Discovers products, adds to cart, manages orders
Examples	ChatGPT's Voice mode, Otter.ai, Google Docs Voice Typing	ChatGPT, Siri, Alexa, Google Assistant, Gemini	Amazon, Walmart

Voice Technology Applications (by sector)

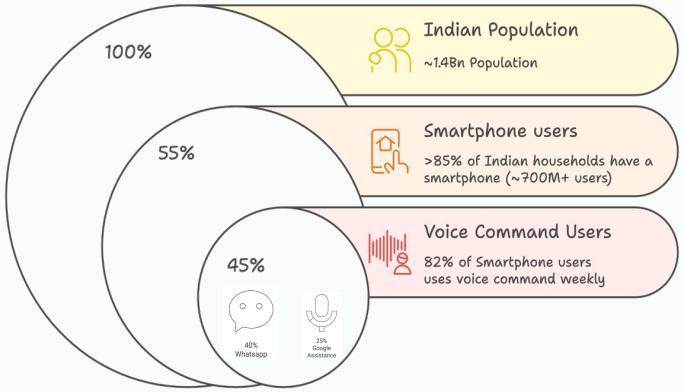


Growth Drivers for Voice Technology in India

Voice adoption in India is accelerating due to rising smartphone penetration, mobile-first internet access, strong government push, cheap data, and growing use of regional languages with better accent recognition.



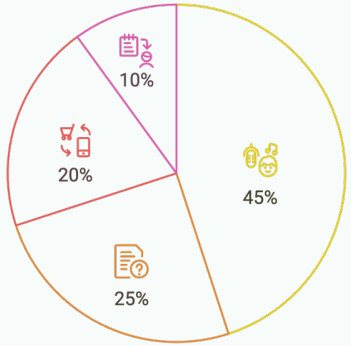
Indian population and voice command users



Key Insights

- Over 82% of smartphone users uses voice command weekly; prominently on Whatsapp and Google Assistant
- Voice search adoption is 270% higher than the global average
- 90% of new users prefer regional languages, and Hindi speakers (500M+) far exceed English speakers (130M)
- Voice usage is normalized (~7Bn voice messages sent daily on WhatsApp)

Voice Assistant use cases



Entertainment 45%	Information 25%	Commerce 20%	Productivity 10%
Enjoying music, podcasts, and games	Seeking quick answers and updates	Shopping and transactions via voice	Managing tasks and setting reminders

Usage Insights

Entertainment dominates voice assistant usage at 45%, followed by information search at 25%. Commerce and productivity applications show significant growth potential.

- Entertainment: Music, games, jokes
- Information: Weather, news, facts
- Commerce: Shopping, banking, payments
- Productivity: Reminders, scheduling

Problem Statement: While voice input is available on the chatgpt app, very few users in India seem to be using it. Voice input could be a powerful tool, especially in a mobile-first country like India, but adoption has remained low. The task is to **increase the usage of voice input on the ChatGPT mobile app**

Slide 2: Insights from analyzing ChatGPT's current UX and comparable voice-first apps

Capability	ChatGPT	Google Gemini	Meta AI	Meta AI WhatsApp integration	Wispr Flow
Live transcription during voice input	✗ Not available (need to click 'see text' button)	✓ Available (auto-sends after short pause)	⚠ Available (not very accurate)	✗ Not available	✗ Not available
Voice-to-Text availability	✓ In-app conversation	✓ In app conversation + integrated in android	✓ In app conversation	✗ Not available	✓ Works across all apps
UX Discoverability (voice input)	⚠ Subtle icon inside text box	⚠ Subtle icon inside text box	✓ Large icon inside text box	✓ Clear separate icon beside text box	✓ Does not require specific button (Shortcut: 'Fn' on keyboard)
Cancel during voice input	✓ Easy (dedicated cancel icon)	⚠ Not intuitive (re-tap mic button)	⚠ Not intuitive (re-tap mic button)	✓ Easy (dedicated cancel icon)	⚠ 'Esc' button (Not intuitive and not accurate)
Live ongoing conversation in Voice Mode	✓ Available	✗ Not available	✗ Not available	— Not Applicable (Does not have voice mode)	— Not Applicable (Does not have voice mode)
Chat history after ending voice mode	Fully available	Fully available	Available but poor transcription and documentation	Not Applicable (Does not have voice mode)	Not Applicable (Does not have voice mode)
Accuracy in Hinglish Voice-to-text	⚠ Struggles with Hinglish and regional languages	✓ Strong Hinglish handling	⚠ Weak Hinglish transcription	— Not available	✓ Excellent Hinglish and reginal language accuracy

Voice Input | Voice Mode | Both

Key insights:

- **ChatGPT has better Voice mode experience** allowing continuous session with live transcription and previous conversations
- **Google Gemini has most accurate Hinglish language handling** among all other apps
- **Meta AI and WhatsApp integration has clear visible voice input buttons** but struggles with local language transcription accuracy
- **Wispr Flow has best use case for Voice-to-text transcription** as it can be used across apps

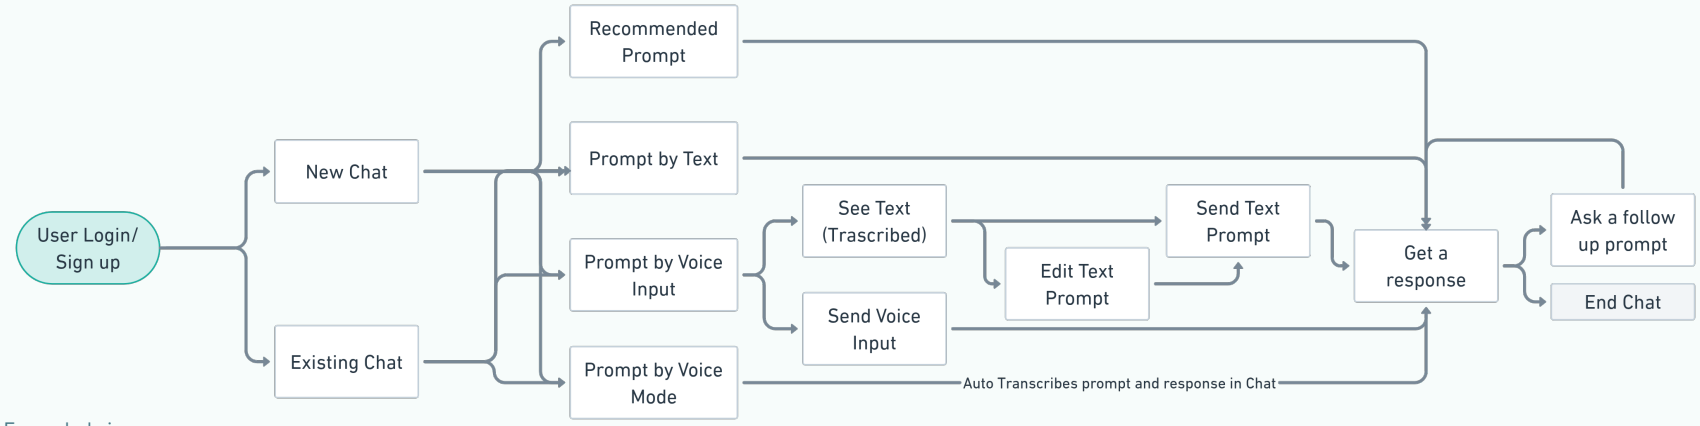
Reasons for Low Voice Mode Usage on ChatGPT:

- **UX friction:** No auto transcription during voice input (Need to click 'see text' button for text)
- **Low discoverability and awareness:** Very subtle icon inside text has low discovery leading to low usability
- **Social awkwardness:** Hesitation to speak to AI in public
- **Privacy Concerns:** Hesitation to have conversation with ChatGPT regarding personal queries in public
- **Limited support for local languages:** Struggles with mixed (Hinglish), regional languages, accents and dialects
- **Input precision:** Voice feels imprecise compared to typing, especially for complex queries

Problem Statement: While voice input is available on the chatgpt app, very few users in India seem to be using it. Voice input could be a powerful tool, especially in a mobile-first country like India, but adoption has remained low. The task is to **increase the usage of voice input on the ChatGPT mobile app**

Slide 3: Why this product outcome matters, User journey and a KPI tree for increasing voice usage on ChatGPT

User Journey (Chat on ChatGPT Mobile Application)

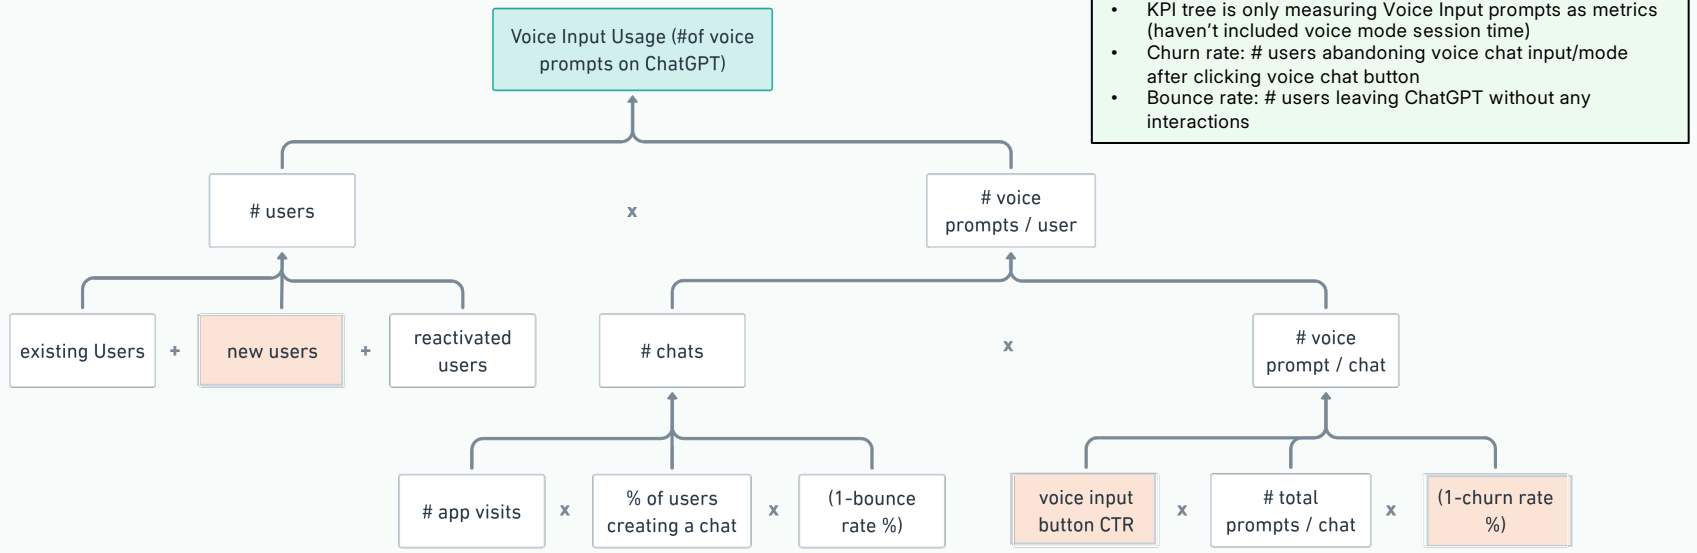


Expanded view

KPI Tree (Voice mode on ChatGPT Mobile)

Assumptions:

- KPI tree is only measuring Voice Input prompts as metrics (haven't included voice mode session time)
- Churn rate: # users abandoning voice chat input/mode after clicking voice chat button
- Bounce rate: # users leaving ChatGPT without any interactions



Expanded view

Business Outcomes

- **Increase in tier-2/3 user base:** Voice input provides natural interface for Tier-2/3 users regardless of English literacy levels.
- **Higher Engagement:** Voice interactions are often faster than typing, allowing users to perform quick tasks efficiently. Ultimately increase in queries leads to increase in engagement time
- **More voice data:** Voice input provides ChatGPT voice data which will improve ChatGPT's voice recognition, accent and language models
- **Expanded Market Reach for Brands:** Businesses can tap into India's vast, non-English-speaking population, which was previously hard to reach digitally, allowing for market expansion and new customer acquisition

Slide 4: Chosen segment and justification of impact
Key Takeaway: Even smaller behavior change to heavy ChatGPT users will lead to bigger impact

Segment 1 (Focal): Working professional who use ChatGPT daily for work and uses typing at default.

I am very fast at typing. I feel voice will slow me down.

Name: Shantanu
Age: 28
Occupation: Manager at Zomato

- Uses ChatGPT daily for work-related and personal tasks (mostly by text)
- Types fast (keyboard typing is muscle memory)

Pain points:
- Voice feels slower than typing
- Hard to structure complex thoughts verbally

I use ChatGPT at work, but I don't want others to know that I am using AI.

Name: Aditya
Age: 32
Occupation: Risk officer at HDFC

- Uses ChatGPT silently during work
- Concerned about being heard while using voice input on AI assistant

Pain points:
- Speaking out loud feels awkward or unprofessional

Segment 2 (Secondary): Students using ChatGPT for Assignments, learning, etc.

I want to ask long questions in step-by-step manner.

Name: Roshni
Age: 19
Occupation: Student at Christ university

- Uses ChatGPT for explanations, notes, assignments
- Types prompts carefully and very structured
- Uses ChatGPT as study partner

Pain points:
- Speaking feels unstructured
- Hard to ask 'step-by-step' questions verbally

Segment 3: Regional language users who struggle to write / speak in English

I don't speak English. I want to use ChatGPT in my native language.

Name: Rakesh
Age: 45
Occupation: Shop owner
City: Jamnagar

- Uses ChatGPT in Gujarati and Hindi language
- Uses for translating words to English, weather updates, general knowledge

Pain points:
- Struggles with wrong translation
- Fears that output might not be correct

Chosen Segment: Segment 1 (Working Professionals, heavy-ChatGPT users)
Justification:
- These users are daily/weekly ChatGPT users for tasks across work-related, creative, learning and personal tasks. These users have strong habit of using ChatGPT but avoids voice due to habit.
- Working professionals drive repeat usage and long-term engagement. By changing habit (of using typing) will make very large impact.

Slide 5: Insights from user research - pain points, blockers

Key Takeaway: Voice input fails not because users are not aware of feature, but because they don't feel fast, safe or precise when they do.

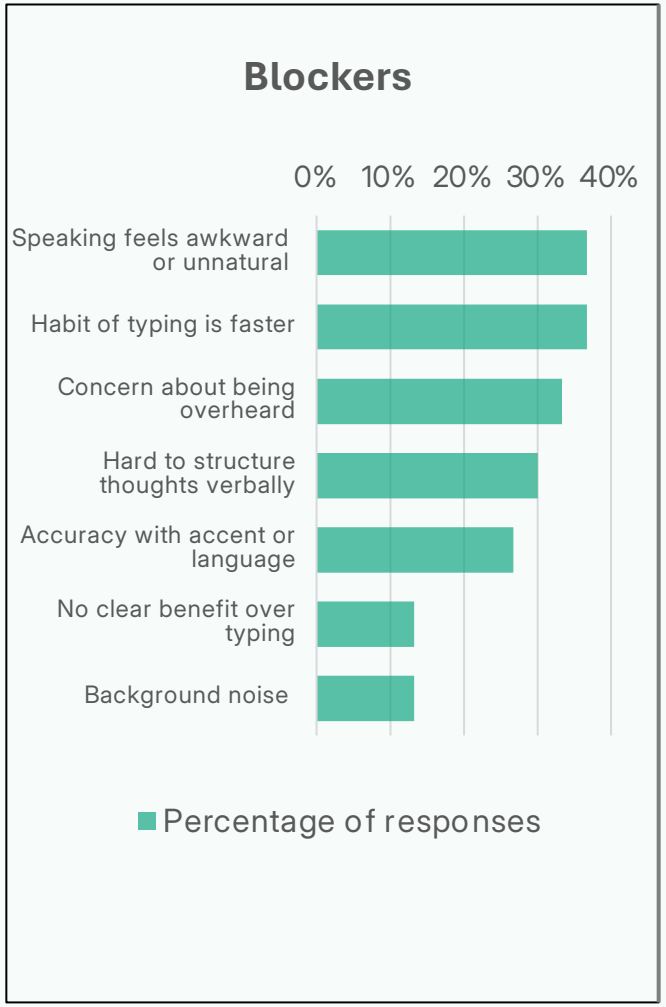
Key Insights

1. It's **not a discovery problem**
2. UX Friction and Accuracy are **not** the Primary Blockers
3. The **real Problem is Massive Drop-off after Trial**
4. Top three **blockers are Habit, Privacy and social awkwardness**
5. Thinking seems natural while typing

Hypothesis	(In) validate ?	Data Points	Insight
Low discoverability and awareness (Very subtle icon inside text has low discovery)	✗ Invalidated	**~97%** of respondents are **aware** about ChatGPT voice input feature	Voice adoption is not blocked by discovery. **Should not focus on making voice button more visible**
UX friction (Users are not finding easier to edit text after speaking)	✗ Invalidated	**Only ~30%** of respondents find it **hard to structure complex thought verbally** and only **~35.5%** respondents would **consider using voice if it's easier to edit text after speaking**	Editing difficulty is a secondary concern, not the primary blocker
Social Friction (Hesitation to speak to AI in public)	✓ Validated	**~56%** of respondents feel at least one of the below **social frictions**: • Speaking feels awkward or unnatural • Privacy issues • Background noise **~45%** of respondents will **consider using voice if they get more privacy** while speaking to ChatGPT in public	Users are **conscious about speaking to AI in public**
Habit of Typing (Typing feels more intuitive than speaking)	✓ Validated	**~40%** of respondents either **feel that typing is faster,** or they **don't find any clear benefit over typing**	**Behavioral issue for type-first ChatGPT users**, especially for complex tasks
Input precision (Voice feels imprecise compared to typing)	✗ Invalidated	**Only ~27%** of respondents has any **issue with accuracy of accent/jargons** while using voice	Technical accuracy is not the primary concern for most users
Retention Issue (Tried voice input but don't use regularly)	✓ Validated	**~81% of users have tried** voice at least once but only **~26% use it regularly**.	Users **abandon voice after initial trial.**

Total Responses: 32 (responses link)

Working-professionals: 68.8%
Freelancers: 21.9%
Students: 9.4%



Slide 6: Problem Framing Canvas

Key Takeaway: Making voice faster, safer and more controllable is required to change habits of type-first users

What is the true problem?

The true problem is habit and privacy. Typing feels faster, safer and more controllable. Voice requires a shift in how people structure their thoughts, and without a strong triggers, users use typing by default.

Who are the customers facing the problem?

The problem is primary for high-frequency ChatGPT users (specially working professionals), who rely on typing as part of their thinking process and have a strong habit of typing inputs.

How do we know it is a real problem?

Survey shows that ~81% of users have tried voice at least once but only ~26% use it regularly. This indicates that users want to adopt voice input but there isn't enough benefits/triggers for them to switch to voice.

What is the value generated by solving this problem?

For the target customer

Users can interact more easily in moments where typing is inconvenient, such as commuting or multitasking. This reduces effort and allows faster capture of thoughts.

For the business

Business has multiple benefits across engagement, richer voice training data and retention.

- Increase voice interaction → more queries per session
- More conversational input → richer training data for speech and language models
- Better mobile engagement → stronger retention

Why should we solve this problem now?

Voice Tech market is projected to expand at a 35.7% CAGR through 2030, reaching nearly USD 1 Billion revenue by 2030. Also, Next billion users won't type but speak to AI. Making ChatGPT voice friendly and habit forming for users will keep it ahead of competitors for voice users.

Slide 7: PRD, Wireframes, Prototype and vibe coding

Key Solution: Contextual Voice nudges: A nudge that suggests voice input to improve voice trial-to-repeat without spamming users.

Microsoft Word Document	PRD Document: Link
	Vibe-coded prototype: Link
